Live Application: <https://grace1513.github.io/careervision-web/>

These links provide access to the project's source code and the deployed version of the CareerVision application.

Technology Stack

CareerVision was developed using the core front-end technologies required for the assessment:

- **HTML5** - used to structure the different pages and interactive elements.
- **CSS3** - used for the visual design, layouts, animations, and responsive behaviour.
- **Vanilla JavaScript (ES6+)** -used for form validation, quiz interactions, scoring, timers, results, and other dynamic features.

No external JavaScript frameworks or Canvas libraries were used. The visualisation on the Results page was created using the native HTML5 Canvas API.

Third-Party Fonts and Icons

The following fonts and icon resources were used in the project:

Resource	Source	License / Terms
Quicksand	Google Fonts	SIL Open Font License
Inter	Google Fonts	SIL Open Font License
JetBrains Mono	Google Fonts	SIL Open Font License
Phosphor Icons	phosphoricons.com	MIT License

These resources were used to improve the readability, visual identity, and usability of the application.

Image Attributions

The background images used throughout the navigation and automatic background system were sourced from **Pexels**.

Pexels provides free stock photography under the Pexels License. Although attribution is not legally required for these images, the sources are listed here for transparency.

File	Description	Source
nav-home.jpg	Homepage navigation hover image	Pexels
nav-paths.jpg	Paths navigation hover image	Pexels
nav-about.jpg	About navigation hover image	Pexels
nav-contact.jpg	Contact navigation hover image	Pexels
default-bg-1.jpg	Default automatic background image 1	Pexels
default-bg-2.jpg	Default automatic background image 2	Pexels

If the assessment requires exact source links, the direct Pexels photo URLs can be added for each image.

Video Attributions

The videos used in CareerVision were created by me using **Canva**.

They are mainly used to make the specialization path cards more interactive and visually engaging. A video is also used as part of the scenario-based quiz question.

No third-party stock video footage was directly downloaded and used in the application.

File	Description
<code>path-lowlevel.mp4</code>	Low-Level Programming path card background video
<code>path-arvr.mp4</code>	AR/VR Development path card background video
<code>path-fullstack.mp4</code>	Full-Stack Development path card background video and quiz scenario clip
<code>path-ml.mp4</code>	Machine Learning path card background video

Any Canva templates, fonts, or other design elements used while creating these videos are subject to Canva's applicable content and licensing terms.

Audio Attributions

The quiz currently uses a **one-second silent audio file** hosted through a public CDN as a development placeholder.

It was added so that the audio functionality for events such as answer selection and countdown ticks could be implemented and tested without using copyrighted sound effects.

At the current stage, no copyrighted music or externally sourced sound-effect content is being used.

If real sound effects are added before the final submission, their source and license information will be added to this section.

AI Usage Disclosure

I used **Claude (Anthropic)** as a development support tool while working on CareerVision.

The main HTML, CSS, and JavaScript code for the project was developed by me. I used Claude mainly to review my existing work, provide feedback, suggest improvements, and help me troubleshoot issues during development.

Claude was used for:

- Reviewing my existing HTML, CSS, and JavaScript code and suggesting improvements.
- Helping identify and troubleshoot coding errors when something was not working as expected.
- Providing feedback on the structure, responsiveness, and usability of the pages.
- Suggesting improvements to the visual design, layout, typography, and user experience.
- Helping improve responsive behaviour, particularly on smaller screens and mobile devices.
- Reviewing the project against the assessment requirements and identifying areas that needed improvement.
- Helping troubleshoot JavaScript interactions, form validation, quiz functionality, and page navigation.
- Providing guidance on Git and GitHub workflow.
- Helping improve and refine the project documentation.

I reviewed the suggestions provided by the AI, adapted them to my project, tested the changes, and decided which improvements to implement.

The overall concept, project direction, content choices, original implementation, and final integration of CareerVision were my responsibility.

AI was therefore used as a **development and learning support tool rather than as a replacement for my own work.**

This disclosure is included to be transparent about the use of AI during the development process and in accordance with the assessment requirement to declare AI usage where applicable.

Final Note

CareerVision was developed as part of the **BSE Specialisation Advisor Assessment** at African Leadership College.

This document records the external resources used in the project and explains how AI was used during the development process.

I have included these sources to give appropriate credit to the creators of the resources used and to keep the development process transparent.
